Abstract

This study shows that full-scale performance measurement is based on a set of well-established mechanisms. Such mechanisms that are primarily focused on the neutralization of disruptions in the management principles can be considered as an effective antidote in preventing a crisis within an organization.

Keywords: symptoms, benefit, disruption, loss, change, efficiency

1 Introduction

In the terminology of creating sustainable “Deming” principles, this means that the presence of effective cures for business illnesses is an adequate immune protection for the organization. Meanwhile, the defense is built upon identifying contradictions, that can be summarized as following: “Seeking higher return on sales without considering the control in the management, exhausts the resources of the enterprise”. Primary problems this research is addressing are the unproductive means of management in the formation, distribution and use of capital during its turnover process.

2 Problem

The solution requires maintaining the initial goal through a set of management tools which make it possible to identify the controlling forces of management that deviate from the goal by uncovering the mismatch of assets and liabilities in the working capital cycle before and after establishing order between the rate of capitalization and return on resources. Main objective of the study is to develop a procedure that will encompass the measurement of an organization's current assets along with the means of recovery of its

depreciated resources whilst taking into account the future revenues towards the current value. To accomplish the task, following objectives have to be executed:

1. Ability to detect and record all attributes of breaches in management principles until completion of the objective.
2. Select an option with the best value for the company out of choices available.
3. Implement a value boosting management scenario, considering the medium term potential growth capacity.
4. Develop an effective protocol for entrepreneurship evaluation in the long term.

3 Conclusion

The results of the study suggest, increasing the evaluation mark leads to a more efficient redistribution of functional responsibilities among those involved in the capital cycle. The novelty of the study is due to the results framework, which incorporates a set of fine-tuned mechanisms to ensure that instances of loss in value due to disruptions in management principles, are captured throughout the life cycle of an organization.
